CGAL: Mission

“Make the large body of geometric algorithms developed in the field of computational geometry available for industrial applications”

CGAL Project Proposal, 1996

Some of CGAL Content

Bounding Volumes

Polyhedral Surfaces

Boolean Operations

Triangulations

Voronoi Diagrams

Mesh Generation

Subdivision

Simplification

Parametrisation

Streamlines

Ridge Detection

Neighbor Search

Kinetic Data Structures

Envelopes

Arrangements

Intersection Detection

Minkowski Sums

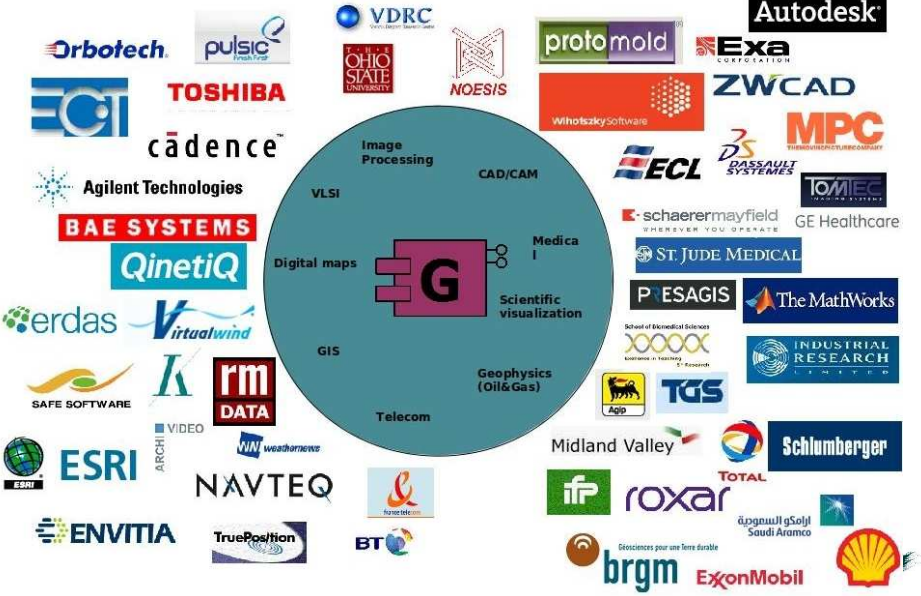

PCA

Polytope Distance

QP Solver

Some CGAL Commercial Users

CGAL Facts

- Written in C++
- Follows the *generic programming* paradigm
- Development started in 1995
- Active European sites:

- 1 INRIA Sophia Antipolis
- 2 INRIA Nancy
- 3 INRIA Saclay - Île de France
- 4 CNRS - LIRIS
- 5 GeometryFactory
- 6 MPII Saarbrücken
- 7 Freie Universität Berlin
- 8 University of Technology Braunschweig

- 9 Tel Aviv University
- 10 ETH Zürich
- 11 University of Crete and FO.R.T.H.
- 12 Università della Svizzera italiana
- 13 Universidade Federal de Pernambuco
- 14 Instituto Nacional de Matemática Pura e Aplicada

CGAL History

Year	Version Released	Other Milestones
1996		CGAL founded
1998	July 1.1	
1999		Work continued after end of European support
2001	Aug 2.3	Editorial Board established
2002	May 2.4	
2003	Nov 3.0	GEOMETRY FACTORY founded
2004	Dec 3.1	
2006	May 3.2	
2007	Jun 3.3	
2009	Jan 3.4, Oct 3.5	
2010	Mar 3.6, Oct 3.7	CGAL participated in Google Summer of Code 2010
2011	Apr 3.8, Aug 3.9	CGAL participated in GSoC 2011
2012	Mar 4.0, Oct 4.1	CGAL participated in GSoC 2012
2013	Mar 4.2, Oct 4.3	CGAL participated in GSoC 2013
2014	Mar 4.4	CGAL participates in GSoC 2014

CGAL in Numbers

- 1,200,000 lines of C++ code
- 10,000 downloads per year not including Linux distributions
- 4,500 manual pages
- 3,000 subscribers to cgal-announce list
- 1,000 subscribers to cgal-discuss list
- 120 packages
- 60 commercial users
- 30 active developers
- 6 months release cycle
- 7 Google's page rank for cgal.org.com
- 2 licenses: Open Source and commercial

CGAL Properties

- Reliability
 - Explicitly handles degeneracies
 - Follows the Exact Geometric Computation (EGC) paradigm
- Flexibility
 - Is an open library
 - Depends on other libraries (e.g., [BOOST](#), [GMP](#), [MPFR](#), [QT](#), & [CORE](#))
 - Has a modular structure, e.g., geometry and topology are separated
 - Is adaptable to user code
 - Is extensible, e.g., data structures can be extended
- Ease of Use
 - Has didactic and exhaustive Manuals
 - Follows standard concepts (e.g., C++ and STL)
 - Characterizes with a smooth learning-curve
- Efficiency
 - Adheres to the generic-programming paradigm
 - ★ Polymorphism is resolved at compile time

CGAL Structure

Basic Library

Algorithms and Data Structures

e.g., Triangulations, Surfaces, and Arrangements

Kernel

Elementary geometric objects

Elementary geometric computations on them

Support Library

Configurations, Assertions,...

Visualization

Files

I/O

Number Types

Generators

...

CGAL Kernel Concept

- Geometric objects of constant size.
- Geometric operations on object of constant size.

Primitives 2D, 3D, dD	Operations		
	Predicates	Constructions	
point	●	comparison	intersection
vector	→	orientation	squared distance
triangle	△	containment	...
iso rectangle	□	...	
circle	○		
...			

CGAL Kernel Affine Geometry

point - origin \rightarrow vector

point - point \rightarrow vector

point + vector \rightarrow point

point + point \leftarrow Illegal

$$\text{midpoint}(a, b) = a + 1/2 \times (b - a)$$

CGAL Kernel Classification

- Dimension: 2, 3, arbitrary
- Number types:
 - Ring: $+, -, \times$
 - Euclidean ring (adds integer division and gcd) (e.g., `CGAL::Gmpz`).
 - Field: $+, -, \times, /$ (e.g., `CGAL::Gmpq`).
 - Exact sign evaluation for expressions with roots (`Field_with_sqr`).
- Coordinate representation
 - Cartesian — requires a *field* number type or *Euclidean ring* if no constructions are performed.
 - Homogeneous — requires *Euclidean ring*.
- Reference counting
- Exact, Filtered

CGAL Kernels and Number Types

Cartesian representation

$$\text{point} \left| \begin{array}{l} x = \frac{hx}{hw} \\ y = \frac{hy}{hw} \end{array} \right.$$

Homogeneous representation

$$\text{point} \left| \begin{array}{l} hx \\ hy \\ hw \end{array} \right.$$

Intersection of two lines

$$\begin{cases} a_1x + b_1y + c_1 = 0 \\ a_2x + b_2y + c_2 = 0 \end{cases}$$

$$\begin{cases} a_1hx + b_1hy + c_1hw = 0 \\ a_2hx + b_2hy + c_2hw = 0 \end{cases}$$

$(x, y) =$

$$\left(\left(\begin{array}{cc|cc} b_1 & c_1 & a_1 & c_1 \\ b_2 & c_2 & a_2 & c_2 \end{array} \right), - \left(\begin{array}{cc|cc} a_1 & b_1 & a_1 & b_1 \\ a_2 & b_2 & a_2 & b_2 \end{array} \right) \right)$$

Field operations

$(hx, hy, hw) =$

$$\left(\left(\begin{array}{cc|cc} b_1 & c_1 & a_1 & c_1 \\ b_2 & c_2 & a_2 & c_2 \end{array} \right), - \left(\begin{array}{cc|cc} a_1 & b_1 & a_1 & b_1 \\ a_2 & b_2 & a_2 & b_2 \end{array} \right) \right)$$

Ring operations

Example: Kernels <NumberType>

- Cartesian <FieldNumberType>
 - `typedef CGAL::Cartesian<Gmpq> Kernel;`
 - `typedef CGAL::Simple_cartesian<double> Kernel;`
 - ★ No reference-counting, inexact instantiation
- Homogeneous<RingNumberType>
 - `typedef CGAL::Homogeneous<Core::BigInt> Kernel;`
- d-dimensional Cartesian_d and Homogeneous_d
- Types + Operations
 - `Kernel::Point_2, Kernel::Segment_3`
 - `Kernel::Less_xy_2, Kernel::Construct_bisector_3`

CGAL Numerical Issues

```
typedef CGAL::Cartesian<NT> Kernel;  
NT sqrt2 = sqrt(NT(2));  
  
Kernel::Point_2 p(0,0), q(sqrt2, sqrt2);  
Kernel::Circle_2 C(p,4);  
  
assert(C.has_on_boundary(q));
```

- OK if NT supports exact sqrt.
- **Assertion violation** otherwise.

CGAL Pre-defined Cartesian Kernels

- Support construction of points from `double` Cartesian coordinates.
- Support exact geometric predicates.
- Handle geometric constructions differently:
 - `CGAL::Exact_predicates_inexact_constructions_kernel`
 - ★ Geometric constructions may be inexact due to round-off errors.
 - ★ It is however more efficient and sufficient for most CGAL algorithms.
 - `CGAL::Exact_predicates_exact_constructions_kernel`
 - `CGAL::Exact_predicates_exact_constructions_kernel_with_sqrt`
 - ★ Its number type supports the exact square-root operation.

CGAL Special Kernels

- Filtered kernels
- 2D circular kernel
- 3D spherical kernel

- Refer to CGAL's manual for more details.

Computing the Orientation

- imperative style

```
#include <CGAL/Exact_predicates_inexact_constructions_kernel.h>

typedef CGAL::Exact_predicates_inexact_constructions_kernel Kernel;
typedef Kernel::Point_2 Point_2;

int main()
{
    Point_2 p(0,0), q(10,3), r(12,19);
    return (CGAL::orientation(q,p,r) == CGAL::LEFT_TURN) ? 0 : 1;
}
```

- precative style

```
#include <CGAL/Exact_predicates_inexact_constructions_kernel.h>

typedef CGAL::Exact_predicates_inexact_constructions_kernel Kernel;
typedef Kernel::Point_2 Point_2;
typedef Kernel::Orientation_2 Orientation_2;

int main()
{
    Kernel kernel;
    Orientation_2 orientation = kernel.orientation_2_object();

    Point_2 p(0,0), q(10,3), r(12,19);
    return (orientation(q,p,r) == CGAL::LEFT_TURN) ? 0 : 1;
}
```

Computing the Intersection

```
#include <CGAL/Exact_predicates_inexact_constructions_kernel.h>
#include <CGAL/intersections.h>

typedef CGAL::Exact_predicates_inexact_constructions_kernel Kernel;
typedef Kernel::Point_2 Point_2;
typedef Kernel::Segment_2 Segment_2;
typedef Kernel::Line_2 Line_2;

int main() {
    Point_2 p(1,1), q(2,3), r(-12,19);
    Line_2 line(p,q);
    Segment_2 seg(r,p);
    auto result = CGAL::intersection(seg, line);
    if (result) {
        if (const Segment_2* s = boost::get<Segment_2>(&*result)) {
            // handle segment
        }
        else {
            const Point_2* p = boost::get<Point_2>(&*result);
            // handle point
        }
    }
    return 0;
}
```

CGAL Basic Library

- Generic data structures are parameterized with Traits
 - Separates algorithms and data structures from the geometric kernel.
- Generic algorithms are parameterized with iterator ranges
 - Decouples the algorithm from the data structure.
